Search Notes

Dear Examiner Williams:

Please review the attached search results.

If you have any questions or if you would like to refine the search query, please feel free to contact me at any time.

Thank you for using EIC 1700 search services!

Ross Shipe (ASRC)
Technical Information Specialist

Voluntary Results Feedback Form

- I am an examiner in Workgroup: Example: 1713
➤ Relevant prior art **found**, search results used as follows:

- ☐ 102 rejection
- ☐ 103 rejection
- ☐ Cited as being of interest.
- ☐ Helped examiner better understand the invention.
- ☐ Helped examiner better understand the state of the art in their technology.

Types of relevant prior art found:

- ☐ Foreign Patent(s)
- ☐ Non-Patent Literature
(journal articles, conference proceedings, new product announcements etc.)

➤ Relevant prior art **not found**:

- ☐ Results verified the lack of relevant prior art (helped determine patentability).
- ☐ Results were not useful in determining patentability or understanding the invention.

If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

particles of lithium nickel compound oxide coated with a lithium titanium compound oxide; weight ratio of the lithium nickel oxide to the lithium titanium oxide is between 96:4 and 65:35; coated particle size or diameter is 5 to 20 micrometers; lithium titanium oxide has a spinel structure in the cubic system; battery using the particle or material as positive electrode active material

Special Instructions and Other Comments:
2-8915

WHAT IS CLAIMED IS:

1. A positive electrode active material comprising:
particles having a layered structure,
the particles comprising:
a first compound oxide of lithium and nickel; and
coating layers formed on at least parts of the
surfaces of the particles,
the coating layers comprising:
a second compound oxide of lithium and titanium.
2. The positive electrode active material according to
claim 1, wherein the ratio by weight of the first compound
oxide to the second compound oxide is between 96:4 and 65:35.
3. The positive electrode active material according to
claim 1, wherein the second compound oxide has a spinel
structure in the cubic system.
4. The positive electrode active material according to
claim 1, wherein the positive electrode active material has
a mean particle diameter of 5 to 20 μm .
5. A non-aqueous electrolyte secondary battery
comprising a positive electrode active material and a

negative electrode active material,

wherein the positive electrode active material
comprises

particles having a layered structure,

the particles comprising:

a first compound oxide of lithium and nickel; and

coating layers formed on at least parts of the
surfaces of the particles,

the coating layers comprising:

a second compound oxide of lithium and titanium.

ABSTRACT OF THE DISCLOSURE

A positive electrode active material includes particles composed of a compound oxide; and coating layers composed of a compound oxide formed on at least parts of the surfaces of the particles. The particles have a layered structure and include a first compound oxide mainly composed of lithium and nickel. The coating layers include a second compound oxide mainly composed of lithium and titanium. The ratio by weight of the first compound oxide to the second compound oxide is between 96:4 and 65:35. The positive electrode active material has a mean particle diameter of 5 to 20 μm .

 NOVELTY - A light emitting element comprises two electrodes, and
 three layers each comprising organic compound and inorganic
 compound.

DETAILED DESCRIPTION - A light-emitting element comprises two
 electrodes (101, 102) and a first layer (111) between the two
 electrodes. The first layer includes a first organic compound and a
 first inorganic compound that exhibits an electron accepting
 property to the first organic compound. A second layer (112) is
 provided between the first layer and the second electrode.
 It includes a second organic compound that is luminescent and a
 second inorganic compound. A third layer (113) is provided between a
 second layer and the second electrode. It includes a third
 organic compound and a third inorganic compound that exhibits an
 electron donating property to the third organic compound.

USE - The light emitting element is used in an electronic
 appliance from video camera, a digital camera, a goggle-type
 display, head mount display, a navigation system, a sound
 reproduction device, an in-car audio system, an audio component, a
 personal computer, a game machine, a personal digital assistance, a
 mobile computer, a cellular phone, a portable game machine, an
 electronic book or an image reproduction device equipped with a
 recording medium (claimed).

ADVANTAGE - The light emitting element that uses a material
 in which an organic compound and an inorganic compound are mixed and
 has a structure different from conventional structures, a light
 emitting element that uses a material in which an organic compound
 and an inorganic compound are mixed and decreases in driving
 voltage, and a light emitting element that uses a material in which
 an organic compound and an inorganic compound are mixed and easily
 prevents short circuit.

DESCRIPTION OF DRAWINGS - The diagram illustrates the
 structure of a light emitting element.

Electrodes (101, 102)

Three layers (111-113)

TECH INORGANIC CHEMISTRY - Preferred Component: The metal oxide is a
 transition metal oxide having a transition metal that belongs to
 Groups 4-12 of the element. It can also be a metal oxide from
 vanadium oxide, molybdenum oxide, tungsten oxide, or rhenium
 oxide. The first inorganic compound is a
 metal nitride. The second inorganic compound is a metal oxide having
 a metal that belongs to Groups 13 or 14 of the element. The metal
 oxide of the second inorganic compound
 can also be a metal oxide from aluminum oxide, gallium oxide,
 silicon oxide or germanium oxide. The second
 inorganic compound is a metal nitride. The third inorganic
 compound is a metal oxide from an alkali metal oxide, an alkaline
 earth metal oxide or a rare earth metal oxide. The metal oxide of
 the third inorganic compound can also be lithium oxide or barium
 oxide. The third inorganic compound can also be a metal nitride from
 an alkali metal nitride, an alkaline earth metal nitride or a rare
 earth metal nitride. The metal nitride is a metal nitride from
 lithium nitride, magnesium nitride or calcium nitride.
 ORGANIC CHEMISTRY - Preferred Component: The first organic compound
 is a hole transporting organic compound. It can also be an organic
 compound having an aromatic amine skeleton. The third organic

compound is an electron transporting organic compound. It is a chelate metal complex having a chelate ligand including an aromatic ring, an organic compound having a phenanthroline skeleton and an organic compound having an oxadiazole skeleton.

NOVELTY - An anode active material contains layered compound containing complex oxide of **lithium, nickel, cobalt, manganese** and at least one of magnesium, aluminum, iron, titanium, gallium, copper, vanadium and niobium. The anode active material is used for aqueous lithium secondary battery (1) containing aqueous electrolyte liquid formed by dissolving lithium salt in water.

DETAILED DESCRIPTION - An anode active material contains layered compound of formula: $\text{Li}_s\text{Ni}_x\text{Co}_y\text{Mn}_z\text{MtO}_2$. The anode active material is used for aqueous lithium secondary battery containing aqueous electrolyte liquid formed by dissolving lithium salt in water.

$s=0.9-1.2$;

$x-z=0.25-0.4$;

$t=0-0.25$; and

M=magnesium, aluminum, iron, titanium, gallium, copper, vanadium and/or niobium.

An INDEPENDENT CLAIM is included for aqueous lithium secondary battery, which has anode (2) containing anode active material, **cathode** (3) containing **cathode** active material and aqueous electrolyte liquid. The **cathode** active material contains a substance whose occlusion-discharge electric potential with respect to lithium is lower than the layered compound in the anode active material.

USE - For aqueous lithium secondary battery (claimed) used as electric power supply for information communication apparatus such as personal computer, mobile telephone and electric vehicle.

ADVANTAGE - The aqueous lithium secondary battery comprising the anode active material, has excellent charging and discharging cycle characteristics and discharge capacitance.

DESCRIPTION OF DRAWINGS - The figure shows structure of aqueous lithium secondary battery. (Drawing includes non-English language text).

aqueous lithium secondary battery (1)

anode (2)

cathode (3)

separator (4)

gasket (5)

TECH INORGANIC CHEMISTRY - Preferred Property: The electrolyte liquid has pH of 6-10.

ABEX DEFINITIONS - Preferred Definitions: - $x-z=0.3-0.35$.

EXAMPLE - An aqueous lithium secondary battery comprising cathode, anode and electrolyte liquid formed by dissolving lithium nitrate in water, was formed. The anode contained anode active material comprising $\text{LiNi}_{1/3}\text{Co}_{1/3}\text{Mn}_{1/3}\text{O}_2$ and cathode active material contained $\text{Li}_{1.5}\text{V}_3\text{O}_y$ ($y=7-8$). The cathode active material had low occlusion-discharge electric potential with respect to lithium than anode active material. The battery had excellent charging and discharging cycle characteristics.

 NOVELTY - A positive active material for a rechargeable lithium battery is prepared by adding first and second compounds to a solvent to prepare an acidic solution with a pH of 0.01-3; adding a lithium-containing compound to the acidic coating solution to coat the lithium-containing compound; and heat-treating the coated lithium-containing compound to form a surface-treatment layer.
 DETAILED DESCRIPTION - Preparation of a positive active material for a rechargeable lithium battery by adding first and second compounds to a solvent to prepare an acidic solution with a pH of 0.01-3; adding a lithium-containing compound to the acidic coating solution to coat the lithium-containing compound; and heat-treating the coated lithium-containing compound to form a surface-treatment layer comprising a compound of formula MXO_k . The first compound forms a double bond with oxygen of a lithium metal oxide, and the second compound includes an element consisting of alkali metals, alkali earth metals, group 13 elements, group 14 elements, transition metals, or rare-earth elements.
 M=alkali metals, alkali earth metals, group 13 elements, group 14 elements, transition metals, or rare-earth elements;

X=element that forms a double bond with oxygen;and
k=2-4.

USE - For preparing a positive active material for rechargeable lithium battery (claimed).

ADVANTAGE - The method provides positive material that exhibits good high temperature swelling characteristics and represses production of lithium carbonate and can produce active materials capable of inhibiting high temperature swelling. It minimizes loss of available lithium and prepares a positive active material without the deterioration of electrochemical characteristics and with good high-temperature swelling characteristics in which volume expansion caused by gas production at high temperatures is reduced.

DESCRIPTION OF DRAWINGS - The figure is a schematic view of a lithium secondary battery.

Negative electrode (2)

Positive electrode (3)

Separator (4)

Battery case (5)

Sealing portion (6)

TECH INORGANIC CHEMISTRY - Preferred Component: The surface-treatment layer further comprises a solid solution comprising an element capable of forming a double bond with an oxygen of a lithium metal oxide, alkali metals, alkali earth metals, group 13 elements, group 14 elements, transition metals, or rare-earth elements. The lithium-containing compound is of formula $LixNiyNl-yO_2-zYz$ or

$x=0.9-1.1$;

$y=0.1-0.9$;

$z=0-0.5$;

N=Al, Ni, Co, Mn, Cr, Fe, Mg, Sr, V, or rare-earth elements;

A=O, F, S, or P; and

Y= F, S, or P.

Preferred Composition: The total amount of the element M and the element X is 0.01-10, preferably 1-4 wt.%. The amount of element M is 0.005-5, preferably 0.5-2 wt.%. The amount of the element X is 0.005-5, preferably 0.5-2 wt.%.

Preferred Property: The pH of the acidic coating solution is 0.8-1.3. The molar mixing ratio of the first compound to the second compound is 0.5-2:1-1.2.

Preferred Property: The surface-treatment layer has a thickness of 0.01-2microns. The positive active material has a tapping density of 1-3 g/cc, a pH of 8-13, and a pH of 10-11.5.

Preferred Condition: The heat-treating step is performed at 450-900degreesC for 1-20 hours.

ORGANIC CHEMISTRY - Preferred Component: The surface-treatment layer further comprises a solid solution comprising an element capable of forming a double bond with an oxygen of a lithium metal oxide, alkali metals, alkali earth metals, group 13 elements, group 14 elements, transition metals, or rare-earth elements. The lithium-containing compound is of formula $LixNiyNl-yO_2-zYz$.

$x=0.9-1.1$;

$y=0.1-0.9$;

$z=0-0.5$;

N=Al, Ni, Co, Mn, Cr, Fe, Mg, Sr, V, or rare-earth elements;

A=O, F, S, or P; and

Y= F, S, or P.

Preferred Composition: The total amount of the element M and the element X is 0.01-10, preferably 1-4 wt.%. The amount of element M is 0.005-5, preferably 0.5-2 wt.%. The amount of the element X is 0.005-5, preferably 0.5-2 wt.%.

Preferred Property: The pH of the acidic coating solution is 0.8-1.3. The molar mixing ratio of the first compound to the second compound is 0.5-2:1-1.2.

Preferred Property: The surface-treatment layer has a thickness of

0.01-2microns. The positive active material has a tapping density of 1-3 g/cc, a pH of 8-13, and a pH of 10-11.5.

Preferred Condition: The heat-treating step is performed at 450-900degreesC for 1-20 hours.

ABEX DEFINITIONS - Preferred Definition: - M=Na, K, Mg, Ca, Sr, Ni, Co, Si, Ti, B, Al, Sn, Mn, Cr, Fe, V, and/or Zr; - X=P, S, and/or W.

EXAMPLE - A solution was prepared by adding 30 g aluminum nitrate nonahydrate, and 10.8 g ammonium phosphate (mole ratio of 1:1) to 400 ml water to prepare an acidic coating solution with a pH of 2.1. To the coating solution was added 100 g lithium nickel cobalt manganate with a diameter of 10 microns prepared by co-precipitation. The coating solution was dried at 130degreesC for 10 hours. The dried material was pulverized and heat-treated at 800degreesC for 7 hours to prepare a positive active material including a surface-treatment layer with a solid-solution compound including aluminum and phosphorus, and an aluminum phosphate compound. The positive active material and a carbon conductive agent were added to a binder solution of a 6 wt.% polyvinylidene fluoride binder in an N-methyl pyrrolidone solvent, at a weight ratio of 96:2:2, and were mixed, thus obtaining a positive active material slurry. The positive active material slurry was coated on an aluminum foil current collector. A graphite negative active material was added to a binder solution of 8 wt.% polyvinylidene fluoride binder in a N-methylpyrrolidone solvent at a weight ratio of 94:6 and mixed to prepare a negative active material slurry. The slurry was coated on a copper foil current collector. The coated current collector was pressed to obtain a positive active mass of 3.5 g/cm and a negative active mass of 1.6 g/cm³. - Using the pressed current collector, a rechargeable lithium battery with a capacity of 700 mAh was fabricated, and was dried for 12 hours. For an electrolyte, 1.15M lithium phosphorus hexafluoride in a mixed solvent of ethylene carbonate, ethyl methyl carbonate and diethyl carbonate (3:6:1 vol. %) was used.

AB US 5750288 A UPAB: 20060114

(I) Composition represented by $\text{Li}_x\text{R}_y\text{Ni}_z\text{O}_2$, where R = at least one non-transition metal from Al, Ga, Sn, or Zn, x is initially 0.95 - 1.05, y is 0.02 - 0.3 and z ~ 2. The composition has a crystalline structure corresponding to an 6 - NaCrO2 structure. Also claimed

(II) is the composition as (I) with R having two components, the first as (I) and the second comprising at least one of Sc and a Period V transition metal having an atomic number 39 - 42, the first component 5 - 95 wt% of R and the second 95 - 5 wt%. Also claimed (III) is the composition as (II) where R is the second component only. Also claimed (IV) is an electrode for an electrochemical comprising the composition as (I) (II) or (III). Also claimed (V) is an electrochemical cell including the electrodes as (IV).

USE - Lithium intercalation secondary batteries.

ADVANTAGE - Increased charge capacity of 5 - 31% over prior

art.

ABDT US5750288

A composition of matter represented by:

$\text{Li}_x\text{R}_y\text{Ni}_z\text{-yO}_z$

R = at least one non-transition metal from Al, Ga, Sn, or Zn;

x = initially 0.95 - 1.05;

y = 0.02 - 0.3; and

z = ~2.

The composition has a crystalline structure corresponding to an 6 - NaCrO₂ structure.

Also claimed is the composition as above with R having two components, the first as above and the second comprising at least one of Sc and a Period V transition metal having an atomic number 39 - 42, the first component 5 - 95 wt% of R and the second 95 - 5 wt%. Further claimed is the composition where R is the second component only.

Even further claimed is an electrode for an electrochemical comprising the composition as in any of the above embodiments.

USE

Lithium intercalation secondary batteries.

ADVANTAGE

Increased charge capacity of 5 - 31% over prior art.

EXAMPLE

Stoichiometric amounts of LiOH, Ni(OH)₂ and R(OH)_x were mixed to give an Li / (Ni+R) ratio of 1 : 1.1 and then ball milled for 30 min. The mixture was then heated in nickel boats in a humid O₂ atmosphere at a first temperature of 650 °C for 10 hr. then cooled to 400 °C and removed from the furnace and ball milled for 30 min. The powder was then re-heated at 650 °C for 3.5 - 5 hr. The resulting powder was then milled for 30 min. and screened < 150 μm. When used as a cathode in a cell the cell showed 5 - 31 % increase in charge capacity depending on current density.

PREFERRED METHOD

The composition has layers of the 6 - NaCrO₂ structure when x < 0.5 and preferably ≤ 0.4. y is 0.05-0.15 and preferably 0.1. The composition particles are ≤ 150 μm diameter. In (II) the first component is 30 - 70 wt% with the remainder the second component.

 The solar cell includes a structure with a sequentially laminated transparent electrode layer, thin film semiconductor layer and back electrode layer on an insulating transparent substrate. The back electrode layer comprises a transparent conductive metal compound layer (e.g. tin oxide) with a lower refractive index than the semiconductor which constitutes the thin film semiconductor layer. Cadmium sulphide is used for the transparent conductive metal compound layer.
 A second thin film solar cell has a sequentially laminated transparent electrode layer, thin film semiconductor layer and back electrode layer on an insulating transparent substrate. The back electrode layer comprises a laminate of an intermediate thin layer containing silver, oxygen and constituent metal elements of a transparent conductive metal oxide and a silver thin film, and zinc is particularly suitable for the constituent metal element of the transparent conductive metal oxide.
 ADVANTAGE - Has improved bonding strength and reflectivity of back electrode layer.

 The manufacturing method forms a compound oxide whose general formula is Li_xNiO_2 where $x > 1.0$. This compound oxide is used as positive electrode active material.
 The molar ratio of lithium to nickel is greater than one. This compound oxide is finally baked at the temperature of 500-1000 deg centigrade in the presence of air.
 USE/ADVANTAGE - In e.g. laptop, VTR, camera, portable telephone. Raises strength ratio and hence discharge capacity. Obtains superb cycle characteristics.

 The manufacturing method incorporates a insulated substrate (1) which is broken into small pieces by means of through holes (21,22). A first electrode layer (3) and a third electrode layer (6) are formed on the whole surface of the substrate. A second transparent layer (5) is formed on the top surface of the substrate. The first and third layers are semiconductor layers. An interface layer consisting of metal oxide or silicon compound is inserted between the first and third electrode layers and the substrate. The first electrode layer and insulated substrate are connected at regular intervals through the through holes.
 ADVANTAGE - Improves adhesion between substrate and electrode layers. Inhibits peeling of layers near through holes. Provides battery with good characteristics and sufficient yield.

 The positive electrode lithium secondary cell using non-aqueous electrolyte is characterised by the presence of a compound oxide. The compound oxide is expressed as $\text{Li}(y)\text{Ni}(1-x)\text{M}(x)\text{O}_2$ where M is chosen from a group of metals such as copper, zinc, niobium, molybdenum and tungsten. At least one of the elements from this group is present in the compound oxide and is used up as active material. The value of x is fixed in the range $0 \leq x \leq 1$, while y content is $0.9 \leq y \leq 1.3$ in the compound oxide.
 ADVANTAGE - Improves capacity and charge discharge nature of secondary cell.

AB The present invention discloses active materials for the pos.
electrodes of rechargeable batteries and the methods of
 fabrication for the active materials as well as pos.
electrodes thereof. The active material comprises of a
 mixture of two components, A and B. A are compds. of lithium nickel
 cobalt metal oxide while B are oxides of lithium cobalt. In a
 preferred embodiment, a formula for the compds. of lithium nickel
 metal oxide, A, is $\text{Li}_a \text{Ni}_{1-b-c} \text{Co}_b \text{M}_c \text{O}_2$ where
 $0.97 \leq a \leq 1.05$, $0.01 \leq b \leq 0.30$,
 $0 \leq c \leq 0.10$, and M is one or more of the following:
 manganese, aluminum, titanium, chromium, magnesium, calcium,
 vanadium, iron, and zirconium. The **weight ratio** of
 A:B is between 20:80 and 80:20. Rechargeable batteries with pos.
electrodes fabricated with the fabrication methods of this
 invention or with the active materials disclosed in this invention,
 exhibit excellent overall and electrochem. properties with no
 formation of halite magnetic domains. They have high discharge
 capacities, high discharge energies, long cycle lives, and excellent
 large discharge current characteristics.

AB The battery has a Li intercalating anode, a nonaq. electrolyte solution, and a Li intercalating cathode using a Li transition metal compound active mass having an α -NaFeO₂ type layered structure; and is prepared by keeping the cathode during initial charging at a potential 100 mV higher than the end-of-charge potential in battery operation for ≥ 50 h. Preferably, the cathode active mass is $\text{Li}_x\text{Ni}_a\text{Mn}_b\text{Co}_c\text{O}_z$, where $0 < x \leq 1.3$, $a < 1.0$, $b < 0.6$, $c < 1$, $(a+b+c) = 1$, and $1.7 \leq z \leq 2.3$.

- AB The battery is characterized by having excellent external insulation. The battery comprises an external packaging member consisting of a metal layer and laminated synthetic resin layers on its inside, an **electrode** laminated body having a pos. **electrode** plate and a neg. **electrode** plate with a separator in between sealed by the packaging member, and **electrode** terminals connected to the **electrode** body and exposed out off the packaging member. The battery group contains plural battery cells.

 AB A pos. electrode active material includes particles
 composed of a compound oxide; and coating layers composed of a compound
 oxide formed on at least parts of the surfaces of the particles.
 The particles have a layered structure and include a **first**
compound oxide mainly composed of **lithium**
and nickel. The coating layers include a **second**
compound oxide mainly composed of **lithium**
and titanium. The ratio by weight of the
first compound oxide to the **second**
compound oxide is between 96:4 and 65:35. The pos.
 electrode active material has a mean particle diam
 . of 5 to 20 μ m.

AB The Mn Ni compound hydroxide particles comprise 1:1 ratio of Mn and Ni, and 0.25-0.45 weight% of sulfate ions, and satisfy sp. surface area of 20-100 m²/g and prescribed x-ray diffraction data (definition given). The hydroxide particles are prepared by mixing and stirring aqueous solns. containing Mn salts and Ni salts (Mn:Ni = 1:1) with alkali solns. in aqueous solns. of pH 9-13 in the presence of complexing agents while keeping the degree of oxidation of Mn ions to coppt. Mn Ni hydroxide. The Mn Ni hydroxide particles and Li hydroxides are mixed and fired to give Li Mn Ni compound oxides (Mn:Ni = 1:1).

 AB A method of manufacturing a nonaq. electrolyte secondary battery is
 provided wherein the pos. **electrode** is made from a
 lithium-metal composite oxide represented by the general formula
 $\text{Li}_x(\text{Ni}_{1-y}\text{Co}_y)\text{1-zMzO}_2$ ($0.98 \leq x \leq 1.10$, $0.05 \leq$
 $y \leq 0.4$, $0.01 \leq z \leq 0.2$, in which M represents
 at least one element selected from the group consisting of Al, Mg,
 Mn, Ti, Fe, Cu, Zn and Ga), and having an average particle diam
 . of 5 μm to 10 μm , a C-amount of 0.14 wt%
 or less measured by way of the high-frequency heating-IR absorption
 method, and a Karl Fischer moisture content of 0.2 wt% or less when
 heated to 180° and the method comprising the steps of
 applying a paste of active material for pos. **electrode** to
electrode plate to make an **electrode**, then drying
 the **electrode**, and pressing and then installing the
electrode in a battery, in a work atmospheric having an absolute
 moisture content of 10 g/m3 or less.

AB		The cathode for secondary battery contains a Li-occluding and releasing cathode active material particles containing Mn and coated with spinel type Li Mn compound oxide $\text{LiMn}_2\text{-aNiMbO}_4$ ($0.45 \leq a \leq 0.55$, $0 \leq b \leq 0.3$, M=Si and/or Ti). In the cathode, leaching of Mn from the cathode active material is prevented. The secondary battery having excellent high-temperature cycle property and storage property is provided with the cathode and anode arranged by facing to the cathode through an electrolyte.

AB The intermediate has the general formula $\text{Ni}_1\text{-xMn}_x(\text{OH})_y(\text{COO})_z \cdot n\text{H}_2\text{O}$ ($0 \leq x \leq 0.55$, $y+z = 2$, $0.5 \leq z \leq 1.5$, $n \geq 0$). The mole ratio of the reactants is $0.25 \leq A/B \leq 0.75$ where A is sum of Ni and Mn, B is $(\text{NH}_4)_2\text{C}_2\text{O}_4$. Ni salt, Mn salt, and $(\text{NH}_4)_2\text{C}_2\text{O}_4$ are mixed, filtered, dried, impregnated with Li salt to maintain the mole ratio $0.95 \leq C/A \leq 1.10$ where C is Li, and calcined under O_2 at $750\text{-}1050^\circ$. The composition of Ni, Mn, and Li can be modified, and is suitable for precursors of cathode active material of secondary batteries.

AB The cathode active mass is LiMO₂ (M = Ni or Ni and ≥1 transition metal) containing a V compound. The V compound is preferably Li₃VO₄ on or near the surface of the LiMO₂. The active mass is prepared by mixing a Li compound with a Mn compound, which is premixed with a V compound, and heating the mixture; or by adding a V compound to LiMO₂ by immersing the LiMO₂ in a melted V compound or in a solution of the V compound.

AB The present invention enables to obtain both of a cycle characteristic and a high load characteristic. The invention discloses a pos. **electrode** active material containing lithium composite manganese oxide having a spinel structure for a nonaq. electrolyte cell and a nonaq. electrolyte cell using this material. The lithium composite manganese oxide having spinel structure has its primary particle ~~diameter~~ not less than 0.05 .mu .m and not greater than 10 μ m, forming an aggregate, and a sp. surface measured by the BET method in a range not less than 0.2 m2/g and not greater than 2 m2/g.

AB The cathode active mass is secondary particles of LiNi_{1-x-y}CoxEyo₂ (E = Mn, Al, and/or Ti, 0.10 ≤ x ≤ 0.20, 0.02 ≤ y ≤ 0.10) primary particles bonded by inorg. oxide containing inorg. binder and has weight loss ≤ 0.5% on its DTA curve when heated to 750° in an inert atmospheric The binder is oxide of Li and ≥ 1 of Mg, Y, Zr, B, Co, and P. The active mass is prepared by sintering a mixture of source compds. of

required elements at a temp T = 500-800°, grinding the sinter in water to average particle diameter $\leq 1 \mu m$, spray drying the slurry to form spherical particles, and re-sinter the particles between T+30 and 900°.

 AB A cathode material for a lithium secondary battery
 comprises a composite oxide powder with median diameter
 3.0-20.0 μ m containing ≤ 10 volume% ≤ 1 -
 μ m particles, represented by the general formula
 $\text{Li}_a\text{Co}_b\text{M}_c\text{Ni}_{1-b-c}\text{O}_2$, where M is ≥ 1 of B, Mg, Al, Si, Ca, Sc,
 Ti, V, Cr, Mn, Fe, Cu, Zn, Ga, Ge, Y, Nb, Mo, Ru, Rh, Pd, Ag, Cd, In
 and Sn; $0 \leq a \leq 1.2$; $0.01 \leq b \leq 0.4$;
 $0.01 \leq c \leq 0.4$; and $0.02 \leq b+c \leq 0.5$. The
 lithium secondary battery exhibits improved charge-discharge cycle
 characteristics.

ICS C01G0053-00; H01M0004-02; H01M0004-04; H01M0010-40

AB PROBLEM TO BE SOLVED: To provide a preparation method for a positive
electrode material for a lithium secondary battery
comprising a compound oxide of Li and

Ni containing Al of homogeneous solid-solution condition,
and having a layer crystal structure of excellent thermal stability,
and provide a preparation method for a precursor composition with
homogeneously dispersed Al used therefor.

SOLUTION: A nickel salt is suspended in water, an alkali salt of an
aluminic acid is dissolved in it, and the alkali salt of the aluminic
acid is neutralized to deposit an aluminum hydroxide. After a
mixture of the deposited aluminum hydroxide and the nickel
salt is dried, a lithium salt is added and mixed to
prepare a precursor composition 1. The precursor composition is
baked in the atmosphere of air containing 1 volume% or more of ozone,
or oxygen to prepare a positive electrode material.

AB	In a Li secondary battery, a neg. electrode active mass is an oxide containing ≥ 1 of a Group IVA element, a Group VA element, In, Zn, and Mg, and a pos. electrode active mass is $\text{Li}_x\text{Co}_y\text{M}_z\text{O}_w$, where M is Ni, V, Fe, Mn, Ti, or Cu; $y_1 = 0.75-1.0$; $y_2 = 0-0.25$; $y_1 + y_2 = 1$; $x = 0.7-1.2$, and $z = 1.5-3.0$. In the pos. electrode active mass, the average diam of particles D is $3 < D \leq 9.0 \mu\text{m}$, and the volume ratio of particles having a diameter of $3-150 \mu\text{m}$ is $\geq 75\%$. The preferred pos. electrode active mass contains Sn oxides. The battery has improved charge-discharge characteristic and safety.

AB	The batteries consists of a non-aqueous electrolyte solution, a neg. electrode containing an active material capable of absorbing or releasing light metals or their alloy, or Li ions, and a pos. electrode containing an active material prepared heating at 450-800° for 3-100 h and then at a temperature 50-600° higher than that at the first time, and cooling at	

0.1-25°/min. The prepared pos. active material is pulverized to average 10-80 μ m with $\geq 75\%$ particles having a diameter 3-15 μ m, and has a sp. surface area 1-10 m²/g. The pos. active material is: $\text{Li}_x\text{M}_y\text{N}_z\text{O}_2$, where M = Co or Ni, N = Ni, V, Fe, Mn, Ti or Cu, $y_1 = 0.6-1.0$, $y_2 \leq 0.4$ ($y_1 + y_2 = 1$), $x = 0.8-1.0$, and $z = 1.5-3.0$. The manufactured batteries show good self-discharge behavior.

AB Cathode active mass in a Li secondary battery is Li_xMyO_2
(M = Co, Ni, Mn, V, Fe, or Ti, x = 0.2-2, and y = 0.8-1.25). The
particles of the cathode active mass have spherical form
with uniformly distributed surface depressions and protrusions. The
particles have diameter 0.1-1.1 μm with median
diameter being 0.5-0.6 μm . The battery has
increased charge and discharge capacity.

AB PROBLEM TO BE SOLVED: To provide a nonaqueous secondary battery which has large energy density per unit volume and satisfactory life performance.

SOLUTION: This nonaqueous secondary battery uses particles, as a positive **electrode** active material, which are formed by flocculating the primary particles of a lithium manganese **compound oxide** and the **primary particles** of a **lithium nickel** compound oxide, the average diameter of the primary particles of the lithium manganese compound oxide being larger than that of the **lithium nickel** compound oxide.

AB PROBLEM TO BE SOLVED: To provide a lithium secondary battery possible to restrict the capacity deterioration and a rise of the internal resistance even in the case of storing the battery for a long time in the high charge rate condition, to provide a lithium-nickel compound oxide for the positive **electrode** active material capable of realizing such a lithium secondary battery, and to provide a simple manufacturing method thereof.

SOLUTION: This lithium-nickel compound oxide has a basic composition expressed with LiNiO_{2-x} and has the hexagonal system layered rock salt structure, and a part of the lithium site and a part of the nickel site is substituted with magnesium. A manufacturing method thereof contains a raw material solution adjusting process, a first hydroxide precipitation process, a second hydroxide precipitation process, and a burning process.

 AB PROBLEM TO BE SOLVED: To provide a lithium titanium compound oxide for an electrode active material which can constitute a lithium secondary battery which is excellent in output characteristics, further excellent in durability such as cycle characteristics and preservation characteristics or the like, especially in durability under high temperature, and a method for easily manufacturing its lithium titanium compound oxide.
 SOLUTION: The lithium titanium compound oxide is made to be expressed with a composition formula $\text{Li}_x\text{Ti}_y\text{O}_4$ ($0.5 \leq x \leq 3$, $1 \leq y \leq 2.5$), and to be observed in a shape of a rectangle with an electron microscope, and to have an average grain size of its grains of 0.2 μm or more and 50 μm or less. Moreover, the manufacturing method has a method in which, after mixing a first lithium compound, a titanium oxide, and the second lithium compound, the mixture is baked at a temperature of 1000 $^{\circ}\text{C}$ or below put above.

 AB PROBLEM TO BE SOLVED: To provide a method for manufacturing a lithium nickel compound wherein a part of Ni site is substituted with Mn in which uniformity of the composition of the lithium nickel compound oxide can be maintained, and to use the lithium nickel compound oxide produced with the manufacturing method as a cathode active material so as to obtain a lithium secondary battery having high capacity and an excellent cycle characteristics especially when used at high temperature.

SOLUTION: Ni and Mn as an essential substituted element are separated out in a compound hydroxide by liquid-phase reaction method (precipitation method). Then mixing a lithium compound in this compound hydroxide and calcining and forming the mixed raw materials, the lithium nickel compound oxide is produced. The lithium nickel compound oxide product in this manner is used as a **cathode** active material and composing a lithium secondary battery.
